

**Safenode**

Safenode Documentation Index

The controlled documentation set for the Safenode product, security model, operations, and integrations.

Document version: 2026-07-27

Product: Safenode

Classification: Internal / customer-safe where noted

Documentation map

Document	Audience	Purpose
Product and Security Overview	Customers, leadership, support	Product thesis, guarantees, responsibilities
Architecture and Data Flows	Engineering, security, reviewers	Components, cryptographic and provider boundaries
Threat Model and Risk Register	Security, engineering, leadership	Threats, controls, residual risks, release blockers
Operations and Incident Response	Operations, on-call, administrators	Deployments, monitoring, incidents, rollback
Secure Development and Release Runbook	Developers, release managers	Testing, review, native release and billing gates
Privacy and Data Handling	Legal, privacy, support	Data classes, third parties, minimization
API and Integration Guide	Frontend/mobile/desktop developers	Endpoints, auth, WebAuthn, billing, diagnostics

Recommended document controls

- Assign an owner to each document and review after every security-sensitive release.
- Keep customer-facing claims separate from internal operating procedures.

- Record changes by release tag and merge commit.
- Do not put live secrets, customer data, or provider credentials in documentation.
- Validate URLs, association files, pricing, and environment names against the deployment at release time.

Safenode positioning

Safenode is best described as a passkey-first secure identity, recovery, and encrypted secret platform. The vault is the encrypted data plane; passkeys, devices, recovery, teams, billing, and audit controls form the security control plane.
