

**Safenode**

Safenode Investor Pitch

A passkey-first security platform for identity continuity and encrypted team secrets.

Document version: 2026-07-27

Product: Safenode

Classification: Internal / customer-safe where noted

Investment thesis

Safenode sits at the intersection of passkey adoption, recovery risk, device governance, and the growing operational-secret problem. The product turns authentication into a broader security lifecycle: prove identity, unlock encrypted data, recover safely, share with governance, and produce evidence.

The core thesis is deliberately focused: the next security layer after passwordless sign-in is continuity and control.

The problem

- Passkeys reduce reusable credential risk but do not solve device loss, recovery, or succession.
- Teams still share API keys, break-glass credentials, and infrastructure secrets through tools not designed for governance.
- Security teams need access evidence and offboarding control without giving a central server plaintext vault access.
- Existing password-manager positioning does not fully address a passkey-first identity world.

The product and moat

- **Cryptographic moat:** WebAuthn PRF can participate in vault-key unwrapping, not merely gate a UI.
- **Architecture moat:** encrypted client boundary preserves zero-knowledge design while policy stays server-side.

- **Workflow moat:** devices, recovery, teams, audit, and billing are one lifecycle.
- **Distribution moat:** individual security creates a natural path into family and team workspaces.

Current evidence

Evidence	Current state
Production platform	Cloudflare Pages frontend and Railway backend are live
Security implementation	Passkey PRF, recovery fallback, memory-only raw key, device policy
Engineering quality	Frontend and backend suites green in the current release branch
Commercial path	Paddle monthly/annual Personal, Family, and Teams pricing
Native path	iOS, Android, and desktop foundations with platform passkey work
Operational controls	Sentry, signed webhooks, CI gates, release and incident runbooks

Business model

Plan	Monthly	Annual
Free	\$0	Free
Personal	\$2.49/mo	\$24.90 billed annually
Family	\$4.16/mo	\$41.60 billed annually
Teams	\$8.32/mo	\$83.20 billed annually

Pricing is an implementation baseline, not a claim of validated willingness-to-pay. Trial duration is controlled by the Paddle price configuration.

Go-to-market

- Start with security-conscious developers, operators, founders, and consultants already adopting passkeys.
- Expand through team invitations, recovery-readiness assessments, and operational-secret use cases.
- Partner with identity, MDR, PAM, cyber-insurance, and security-platform companies for distribution and control-plane integrations.

Capital use framework

- Harden production assurance: independent penetration testing, threat-led reviews, and compliance readiness.
- Complete native release operations: signing, notarization, stores, association files, and support.

- Build team administration, integrations, secret rotation, and enterprise reporting.
- Fund reliability, support, security operations, and measured demand generation.

Safenode should set the funding amount after confirming the lead investor, runway target, and validated acquisition economics rather than presenting an unsupported number.

Investor diligence posture

- No fabricated traction is presented in this deck.
- Security claims are design and implementation claims, not SOC 2, ISO 27001, or penetration-test certification.
- Diligence materials should include the architecture, threat model, test evidence, deployment controls, privacy posture, and incident response plan.
